

Outpatient Infection Control Guideline Checklist

Public Health Agency
Level 2

The current state of the issue

Over the past few decades, healthcare delivery has largely moved from acute inpatient facilities to outpatient and community-based settings.¹ Proper infection control practices are essential to reduce the risk of healthcare-acquired infections.² The Centers for Disease Control (CDC) developed minimum expectations for outpatient infection control in 2016, but emerging pathogens and the COVID-19 pandemic have highlighted the need for more robust procedures.³ These guidelines focus on infection control measures for outpatient healthcare settings. While they provide a general outline to improve infection control practices, each site must adhere to applicable regulations from the CDC, Department of Health, and their local health jurisdiction as needed.

Prevention

- ☐ Expand access to vaccines and ensure efficient and equitable roll-out of vaccine programs.
- ☐ Engage with local voices from community members and physicians to adapt guidelines to address the needs of impacted communities.
- ☐ Provide technical assistance and education in a non-regulatory process to outpatient health facilities. Technical assistance programs include the [Department of Health Infection Control Assessment and Response](#) (ICAR) program and the [Labor and Industries Consultation Program](#).

Community Spread

- ☐ Provide public communication campaigns on Infection and Prevention Control (IPC) and community spread of infectious diseases. When possible, use trusted community voices who champion infection prevention and control to help with outreach.
