Bree Collaborative Background

The Dr. Robert Bree Collaborative was established in 2011 by Washington State House Bill 1311 “...to provide a mechanism through which public and private health care stakeholders can work together to improve quality, health outcomes, and cost effectiveness of care in Washington State.” The Bree Collaborative was named in memory of Dr. Robert Bree, a leader in the imaging field and a key member of previous health care quality improvement collaborative projects.

Members are appointed by the Washington State Governor and include public health care purchasers for Washington State, private health care purchasers (employers and union trusts), health plans, physicians and other health care providers, hospitals, and quality improvement organizations. The Bree Collaborative is charged with identifying health care services annually with substantial variation in practice patterns, high utilization trends in Washington State, or patient safety issues. For each health care service, the Bree Collaborative identifies and recommends best-practice, evidence-based approaches that build upon existing efforts and quality improvement activities to decrease variation. In the bill, the legislature does not authorize agreements among competing health care providers or health carriers as to the price or specific level of reimbursement for health care services. Furthermore, it is not the intent of the legislature to mandate payment or coverage decisions by private health care purchasers or carriers.

See Appendix H for a list of current Bree Collaborative members.

Recommendations are sent to the Washington State Health Care Authority for review and approval. The Health Care Authority (HCA) oversees Washington State’s largest health care purchasers, Medicaid, and the Public Employees Benefits Board Program, as well as other programs. The HCA uses the recommendations to guide state purchasing for these programs. The Bree Collaborative also strives to develop recommendations to improve patient health, health care service quality, and the affordability of health care for the private sector but does not have the authority to mandate implementation of recommendations.

For more information about the Bree Collaborative, please visit: www.breecollaborative.org.

Bree Collaborative members identified perinatal behavioral health as a priority improvement area and convened a workgroup to develop evidence-informed standards. The workgroup met from January 2022 to January 2023.

See Appendix I for the workgroup charter and a list of members.
Background

The perinatal period, defined here as including the time from conception until the end of the first year after birth, involves significant physiological and psychosocial change. Pregnancy and parenting are life altering events that may result in new or increased behavioral health symptoms for the person who gave birth (i.e., gestational parent). Behavioral health diagnoses can be disruptive and concerning to the person experiencing them and have a negative impact on the fetus and newborn, as a strong predictor of infant health is the wellbeing of the parent. The term behavioral health includes both mental health and alcohol or other substance misuse (e.g., opioids).

Postpartum depression is common, impacting 10-15% of gestational parents with symptoms ranging from minimal to severely disruptive in self and infant care. In some more rare cases, postpartum depression can include psychosis. Rates of postpartum depression are higher among those with a pre-pregnancy depression diagnosis, who are American Indian/Alaska Native, who smoked during or after pregnancy, who experienced intimate partner violence before or during pregnancy, or whose infant died since birth. Postpartum anxiety disorders are also very common and estimated to occur in 21% of gestational parents postpartum. Mental health concerns in the perinatal period can increase risk for minimal or absent prenatal care, and depression, anxiety and other mood disorder symptoms may increase in prevalence or severity postpartum. When not addressed, there is an increased incidence of adverse outcomes including preterm birth, low birth weight for neonates, impaired bonding, and difficulty with mood regulation for offspring later in childhood.

Pregnant and postpartum individuals with mental health concerns are at greater risk for substance use and abuse. Alcohol and substance use during the perinatal period, especially during pregnancy, is likely underreported and can cause psychological harm to the fetus. Survey data shows about 6% of pregnant people using drugs other than those prescribed, 8.5% drinking alcohol, 16% smoking, and about 2.5% receiving at least one opioid prescription. Perinatal opioid use has increased as in the general population.

Pregnant and postpartum individuals have more frequent interactions with the healthcare system but are less likely to receive adequate care for behavioral health conditions compared with the general population. To adequately meet patient needs and population health goals, behavioral healthcare should be integrated into all settings where perinatal people interact with the healthcare system and providers. Perinatal behavioral health screening effectiveness is contingent on availability of adequate follow up and treatment options for those who screen positive. Behavioral health integration improves efficacy of referrals, reduce barriers to treatment and improve outcomes for perinatal individuals. When full integration is not possible, at a minimum perinatal providers should have a follow Screening, Brief Intervention and Referral to Treatment (SBIRT) protocols that provide early identification and intervention.

This guideline was informed by Agency for Healthcare Research and Quality (AHRQ) topic brief on Pregnant and Postpartum Behavioral Health Integration and draws on and supplements the Bree Collaborative’s report on Behavioral Health Integration into primary care. These guidelines also draw from the Collaborative Care Model, developed by the UW AIMS Center, that has had significant success identifying and treating depression in perinatal clinics, decreasing racial disparities in screening and referral to treatment, and can be adapted for use in rural settings. The AIMS Center uses five principles to define Collaborative Care, see more here. This guideline also supplements The American College of
Behavioral health treatment in the perinatal period should be informed by symptom severity and patient preference. In most cases, mild to moderate depression and anxiety can be managed in the perinatal setting while patients with more severe symptoms or diagnoses may require a referral to specialty behavioral health. For individuals with opioid use disorder (OUD), most pregnant individuals should remain on medications for OUD (MOUD) as it prevents relapse and potential further harm to parent and child.\textsuperscript{21} If prenatal providers opt to refer patients out for specialty mental health treatment, attempts should be made to track these referrals as evidence suggests that less than 20\% of patients follow up on specialty behavioral health referrals.\textsuperscript{22} For patients with opioid use disorder, providers should follow the Committee on Obstetric Practice and American Society of Addiction Medicine joint opinion \textit{Opioid Use and Opioid Use Disorder in Pregnancy} and the most updated Bree Collaborative Report on \textit{Opioid Use Disorder Treatment}.

The Perinatal Behavioral Health topic was selected by Bree Collaborative members in September 2022 and a workgroup of clinical and community experts met from January 2022 to January 2023. The Bree recommendation focus areas are organized around identifying a person with or at risk for perinatal behavioral health needs and ensuring they receive appropriate follow-up care. To identify focus areas, the workgroup relied on existing guidelines from ACOG, American Academy of Pediatrics (AAP), Agency for Healthcare Research and Quality, available evidence, and expert opinion.

\textbf{Focus Areas (informed by AHRQ guidelines)}\textsuperscript{23}

<table>

<tr>
<th>Focus Area</th>
<th>Action Steps</th>
</tr>
</thead>
</table>
| Education and communication               | • Communication between patient and provider  
• Patient education  
• Public health education | |
| Integrated behavioral health              | • Universal Screening, Brief Intervention, and Referral to Treatment protocols.  
• Integration of behavioral health (e.g., collaborative care), co-located care, referral systems and/or community linkages to higher levels of behavioral health care  
• Coordinated treatment for pregnant and postpartum individuals experiencing substance use disorders. | |
| Care coordination                         | • Operational systems for quick coordination and triage.  
• Care coordinators’/peer navigators’ role and integration | |
| Community linkages to social programs     | • Referral pathways to community-based resources and organizations  
• Partnerships with community. | |
| Expanded team roles                       | • Roles of community-based/additional perinatal providers in supporting perinatal behavioral health.  
• Expanded reimbursement | |
These focus areas were synthesized into guidelines for each of the following audiences: Perinatal Care Providers, Pediatric Providers and Clinics, Perinatal Care Delivery Systems, Health Plans, Purchasers, Public Health, and the Washington State Legislature.

Guidelines

Perinatal Care Providers

☐ Consistently provide trauma-informed, patient-centered, and culturally humble perinatal care. Provide care in alignment with harm reduction principles. See Appendix A: Culturally Humble Care
  ○ Inquire about patient’s mental health, life stressors and well-being, and ongoing healthcare in the postpartum period through trauma-informed, culturally humble care during each visit. Inquire about connection to community resources and birthing support, such as doulas. Connect to resources if wanted. See Appendices B and C for a non-exhaustive list.

☐ Explain the purpose of screening for depression, anxiety, suicidality, alcohol misuse, and substance use including the safety and security of the information to patients.

☐ Be aware of community and culturally aligned resources available to perinatal individuals. Educate patients on benefits that these resources can provide. See Appendices B and C for a non-exhaustive list.

☐ Screen every pregnant person for and/or review prior diagnoses of depression, anxiety, suicidality, and tobacco, marijuana, alcohol, and other substance use at intake, at least every trimester, and at routine postpartum visits using a validated instrument(s), as recommended by the American Academy of Obstetricians and Gynecologists (ACOG) and the US Preventive Services Task Force (USPSTF); document in the medical record using structured data fields. Screening can be performed by another care team member as part of team-based care.
  ○ Depression (e.g., Edinburgh Postnatal Depression Scale or the Patient Health Questionnaire-2, -3, or-9)
  ○ Anxiety (e.g., Generalized Anxiety Disorder-2, -7)
  ○ Suicidality: (e.g., if positive on PHQ-9 or EPDS use C-SSRS, first and second questions of the Columbia Suicide Severity Rating Scale (C-SSRS), or the Ask Suicide-Screening Questions (ASQ) as well as current plans and any past attempts).
  ○ Bipolar Disorder: (e.g, MDQ, CIDI or other validated instrument) at a minimum screen at intake. Ensure screening for bipolar disorder is completed before beginning pharmacological therapy for depression or anxiety.
  ○ Tobacco, marijuana, alcohol (e.g., AUDIT-C), opioid use disorder and other substance use (e.g., single-item screener, ASSIST, DAST-10, single item cannabis and other drug use questions.)

☐ If someone is undergoing active treatment for a behavioral health diagnosis, check for any contraindicated medication in pregnancy, coordinate with other providers, and do not unnecessarily stop treatment.
If positive on screening, tailor brief intervention and treatment to screening results (see below). Provide warm handoff to specialty behavioral health if warranted based on results. Coordinate care with other providers.

- **Depression and anxiety:** For mild depression and anxiety (depending on scale used), provide education and referral to therapy; for moderate-severe depression, provide therapy and/or medication management.
  - Ensure patient is connected to evidence-based follow-up treatment using warm-handoff and direct follow-up if same-day treatment is not possible.
  - Prior to beginning pharmacotherapy for depression, screen for bipolar disorder using a validated instrument.
  - Provide contact and support during transitions of care.

- **Bipolar Disorder:** do not unnecessarily discontinue mood stabilizers during pregnancy unless medication is contraindicated.
  - Ensure patient is connected to evidence-based follow-up treatment using warm-handoff and direct follow-up if same-day treatment is not possible.
  - Provide contact and support during transitions of care.

- **Suicide:** If suicide risk is detected, make a suicide safety plan and follow guidelines within the 2018 Bree Collaborative Suicide Care Report and Recommendations, or more recent guidance if available. See Appendix G for an Example Suicide Safety Plan.
  - Ensure individuals at risk of suicide have pathway to timely and adequate care (e.g. follow-up contact same day or later as indicated by suicide risk assessment).
  - Keep patients in an acute suicidal crisis in an observed, safe environment.
  - Address lethal means safety (e.g., guns, medications).
  - Engage patients in collaborative safety planning.
  - If possible, involve family members or other key support people in suicide risk management.
  - Use effective evidence-based treatments provided onsite that directly target suicidal thoughts and behaviors (rather than focusing primarily on specific mental health diagnoses) through integrated behavioral health or off-site with a supported referral.
  - Document patient information related to suicide care and referrals.
- Provide contact and support during transition from inpatient to outpatient sites, and from outpatient to no behavioral health treatment.

- Provide numbers for crisis resources (e.g., 988, Native and Strong Lifeline, Maternal Mental Health Hotline 1-833-TLC-MAMA (1-833-852-6262), see Appendix B for more information)

  - **Alcohol**: Educate on the risks of any alcohol exposure on the developing fetus. Use the Frequently Asked Questions from ACOG for assistance having a conversation about fetal alcohol spectrum disorders [here](#). No amount of alcohol is safe during pregnancy.

  - **Tobacco**: Educate on the risks of tobacco use when pregnant. Council patient on benefit of smoking cessation. Follow ACOG guidance [here](#).

  - **Other non-opioid drugs**: Follow ACOG’s [Substance Use Disorder in Pregnancy](#) guidelines. Opioid use is covered separately and, in more detail, due to the availability of opioid agonist therapy.

  - **Opioid use**: Provide counseling and education on pharmacotherapy for opioid use disorder, continued use of legal and illicit substances while pregnant, withdrawal from opioids while pregnant, and risks for pregnant person-baby dyad if relapse occurs.

    - **Start patients on opioid maintenance therapy** as early as possible in pregnancy to help reduce the severity of neonatal abstinence syndrome.

    - After a positive screen for opioid use disorder, medical examination and psychosocial assessment should be performed by a qualified provider.

    - Co-manage care for patients who are pregnant with opioid use disorder with a prenatal care provider and an addiction specialist as available.

    - Use a supported referral or warm handoff, such as reviewing the care plan in person or over the phone during handoff, to a setting offering methadone or buprenorphine and harm reduction related services rather than withdrawal management or abstinence. Hospitalization during initiation may be advisable.

    - Consider partial hospitalization or outpatient intensive programs such as the PCAP program as clinically appropriate.

    - For patients in need of hospitalization, consider a supported referral to Substance Using Pregnant People (SUPP) Program for individuals who are pregnant, covered through WA Apple Health and have a substance use history. See more details [here](#).

    - Follow SAMSHA’s [Clinical Guidance for Treating Pregnant and Parenting Person With Opioid Use Disorder and Their Infants](#)

- Screen every pregnant or postpartum person at **initial prenatal visit, later in pregnancy, and postpartum visits** for Intimate Partner Violence (IPV), and social needs. Consider screening for
adverse childhood experiences (ACEs). Educate the patient and support system on the purpose of screening for social determinants of health (SDOH), IPV and ACEs.

- **IPV:** (e.g., USPSTF referenced tools) Follow ACOGs recommendations on framing statements, screening location, and patient education.
- **Social Determinants of Health** (e.g., PRAPARE) Screen pregnant or postpartum person for SDOH needs utilizing a validated tool. Follow the Foundation for Health Care Quality’s Social Need Screening Report.

☐ **If positive**, tailor the care plan to results:
  - IPV: Follow USPSTF recommendations for components of effective ongoing support for IPV
  - SDOH: Follow Foundation for Health Care Quality’s Social Need Screening Report and Social Need Interventions Report to support a person with identified SDOH needs.

☐ Identify and facilitate inclusion of external/community-based care coordinators or case managers in care planning.
  - For patients on Medicaid (Apple Health), refer to Maternity Support Services (MSS) in the appropriate county for support, education, resources, and care coordination. See Appendix C: Additional Support Services for more information on MSS and other resources available.

☐ Educate patients on signs and symptoms of mental health concerns that may arise during pregnancy and after, the importance of integrated behavioral health care and how they can participate in care planning and shared decision-making. See the Center for Disease Control’s (CDC) Hear Her Campaign for resources to support conversations.

☐ Consider sharing your identities in your professional bios to facilitate patients’ ability to choose a racially and/or culturally concordant provider.

☐ Provide educational and community resources to patients to support perinatal and postpartum needs as appropriate. A non-exhaustive list is included in Appendix E: Additional Support Services.

**Providers and Clinics working with Pediatric Patients**

☐ Consistently provide trauma-informed, patient-centered, and culturally humble perinatal care. Provide care in alignment with harm reduction principles. See Appendix A: Culturally Humble Care
  - Inquire about patient’s mental health, life stressors and well-being, and ongoing healthcare in the postpartum period through trauma-informed, culturally humble care during each visit. Inquire about connection to community resources and support. Connect to resources if wanted. See Appendix A for Culturally Humble Care and Appendices B and C for a non-exhaustive list of resources.

☐ Explain the purpose of screening for depression, anxiety, suicidality, alcohol misuse, and substance use including the safety and security of the information to patients.
Screen postpartum people for behavioral health concerns according to AAP, USPSTF, and Bright Futures guidelines of 1-, 2-, 4-, and 6-month well-child visit; continue screening through all 1-year well-child visits and consider continuing screening throughout all well-child visits after 1-year. Consider incorporating routine screenings for the Social Determinants of Health, (SDOH), Intimate partner violence (IPV) and Adverse Childhood Experiences (ACEs) into well-child visits. Incorporate screenings into routine workflows. Example workflow for postpartum depression screening here. If screenings are negative, provide education to pregnant or postpartum people and support system on signs and symptoms of behavioral health concerns that may arise after birth. If screenings are positive, develop a plan on the same day for intervention when perinatal mood disorders or other behavioral health concerns are identified AND provide education on signs and symptoms of behavioral health concerns that may arise after birth.

- Inform and educate patients on findings, diagnosis, and resources to support them.
- Consider and develop pathways to coordinate care with parent’s postpartum clinician (e.g., obstetrician, family medicine, primary care provider).
- Depression, anxiety and substance use can impact the relationship between child and caregiver: Assess relationship between child and caregiver and refer to infant mental health specialist for dyad treatment if necessary.
- Connect the patient and parent with other care team members to support their referral to interventions for the further assessment and treatment of the parent, and community resources to the support of the parent-child dyad. Follow up with the parent within two weeks to ensure connection to appropriate treatment and resources.

Track system-level data regarding screening for behavioral health and follow up. If system goals are not met, use quality improvement efforts to achieve screening and follow up goals and outcome standards.
Outpatient Perinatal Care Clinics/Facilities

- Consistently provide trauma-informed, patient-centered, and culturally humble perinatal care from all staff (e.g., obstetricians, midwives, other clinicians, and other community service supporters of pregnant and postpartum people.) Provide care in alignment with harm reduction principles. See Appendix A: Culturally Humble Care

- Ensure that all staff who interact or treat pregnant and postpartum people understand and/or have received training on: (see Appendix D: Provider and Allied Professionals Training for Training Resources)
  - Trauma-informed care principles.
  - Harm reduction techniques.
  - Implicit bias and antiracism training.
  - Patient-centered care.
  - Gender-neutral/gender-inclusivity.
  - Mental health and substance use disorder among individuals who are pregnant and postpartum, and treatment protocols for individuals identified as experiencing these behavioral health concerns.
  - Protocols and procedures related to integration of behavioral health into perinatal care at their facility.

- Offer to connect perinatal patients to a racial, cultural or gender-identity concordant provider when possible.

- Educate patients on the role of doulas and other community birth supports. Facilitate doulas’ inclusion in the care team when applicable and/or chosen by the patient.

- Develop a perinatal patient registry with the ability to track individuals from intake through 12 months postpartum. Use registry to track system level behavioral health screening, intervention and referrals. Consider stratifying the registry by interoperable REaL data, SOGI data and payer status to identify and track inequities. If system goals are not met, use quality improvement efforts to achieve screening and follow up goals and outcome standards.

- Integrate behavioral health into routine perinatal care. This can include integration of perinatal care into behavioral health settings, such as substance use disorder clinics, the full Collaborative Care Model that includes telehealth or virtual modalities for consultation and use of the registry, or other models of integrated care.
  - As resources allow, co-locate behavioral healthcare with perinatal care providers to allow for same-day interventions for behavioral health.

- Enable perinatal providers to provide care for mild behavioral health concerns by supporting training and continuing education on perinatal behavioral health.

- Facilitate communication and inclusion in care planning across members of the care team, including perinatal clinicians, community services, and behavioral health providers.

- Prior to implementing perinatal behavioral health screening, engage with multidisciplinary staff members and partner with program champions.
Offer an easy-to-access specialty behavioral health referral list for perinatal providers to conduct a warm handoff.

Establish protocols for screening, treatment and referral that follow most up-to-date clinical guidelines, align with onsite available resources and/or known community resources, and incorporate protocols into routine clinical practices during routine visits. Ensure screening is universally and equitably administered.
  
  o Include protocols and procedures for all prescribers to be empowered to prescribe medications for opioid use disorder, as an x waiver is no longer required to prescribe.
  
  o Consider including resources such as the Perinatal Psychiatry Consultation Line in protocols.

Provide screening and educational materials in multiple languages at a 6th grade reading level. Have screening accessible to complete online via patient portals prior to visits.

Create systems for supported referrals to a setting offering methadone or buprenorphine rather than withdrawal management or abstinence. Hospitalization during initiation may be advisable.

Develop pathways to address and consider individual social needs, such as transportation to and from clinics, connection to resources for food insecurity and housing instability. Follow Foundation for Health Care Quality Guidance on Social Needs Intervention.

Develop pathways to connect patients to existing public health resources such as First Steps through your local health jurisdiction.

Develop protocols and procedures to support care team screening for intimate partner violence (IPV) according to ACOG guidance, including providing private and safe setting for the birth parent alone for screening, integrating screening into routine protocols and providing available resources for providers and patients.

Connect medical residents to providers currently providing perinatal behavioral health care.

Change clinic/facility policy to address structural barriers in care.
  
  o Increase clinic hours to accommodate late or early appointments.
  
  o Create child-friendly waiting and examination rooms.
  
  o Adopt telehealth modalities of delivering care.
  
  o Provide translation and/or interpretation services to all patients.

Develop capabilities to measure and track a set of performance measures related to behavioral health in the perinatal period.
  
  o Patient-reported outcome measures on perceived discrimination and mistreatment during pregnancy (e.g., PREM-OB).
  
  o Inequities in screening, treatment progress, referrals and outcomes by socioeconomic status and race/ethnicity.

**Birthing hospitals**

Consistently provide trauma-informed, patient-centered, and culturally humble perinatal care from all staff (e.g., obstetricians, midwives, other clinicians, and other community service
supporters of pregnant and postpartum people.) Provide care in alignment with harm reduction principles. See Appendix A: Culturally Humble Care

- Ensure that all staff who interact or treat pregnant and postpartum people understand and/or have received training on: (see Appendix D: Provider and Allied Professionals Trainings for Training Resources)
  - Trauma-informed care principles.
  - Harm reduction techniques.
  - Implicit bias and antiracism training.
  - Patient-centered care.
  - Gender-neutral/gender-inclusivity.
  - Mental health and substance use disorder among individuals who are pregnant and postpartum, and treatment protocols for individuals identified as experiencing these behavioral health concerns.
  - Protocols and procedures related to integration of behavioral health into perinatal care at their facility.

- Align with requirements to become a Birthing Center of Excellence from the DOH. Criteria are below:
  - Screen every person giving birth for substance use disorder with a validated screening tool upon admission.
  - Screen every person giving birth for perinatal mood and anxiety disorders (PMADS) with a validated screening tool upon admission (validated with the perinatal population)
  - Have a provider on-site with skills and scope to begin maintenance medications that treat OUD and/or adjust maintenance medications that treat OUD during labor and delivery and postpartum.
  - If the hospital does not have an on-site/on-call provider, there is a procedure in place to consult with a provider to initiate/adjust maintenance medications.
  - Allow birth parent and infant to room together, unless parent is in ICU or medical reasons other than neonatal abstinence syndrome for the infant to be in the neonatal intensive care unit (NICU).

- Consider participating in the Washington Health Care Authority's Substance Using Pregnant People (SUPP) Program for individuals who are pregnant, covered through Apple Health and have a substance use history. See more details here.

- Connect medical residents to providers currently providing perinatal behavioral health care.

- Offer an easy-to-access specialty behavioral health referral list for providers to conduct a warm handoff at discharge.
Health Plans

☐ Cover licensed nurse midwives and certified nurse midwives in addition to obstetricians and family medicine as perinatal care providers.

☐ Increase coverage for perinatal behavioral health services to reduce financial barriers to care, such as Medicaid programs offering behavioral health consultations.

☐ Increase availability and reimbursement for perinatal behavioral health services within OB and Pediatric clinics for improved access to services.

☐ Reimburse for
  - Doula support during the perinatal period.
  - Telehealth services
  - Perinatal providers and/or care teams to perform warm handoffs and shared referrals, including to settings offering methadone or buprenorphine.

☐ Consider pathways to reimburse for care coordination and warm handoffs between pediatricians and obstetrical care/primary care providers for identified behavioral health concerns or needs.

☐ Cover prescription naloxone at no cost-sharing.

☐ Consider and reimburse diverse models of perinatal care delivery to address perinatal behavioral health concerns. Potential models include:
  - Integrated Behavioral within Perinatal healthcare, including co-location of behavioral health services and Collaborative Care.
  - Home visits by nurse for perinatal care.
  - Group prenatal care
  - Telehealth modalities of care.
  - Community midwives
  - Community health workers

☐ Have a system to track behavioral health screening and referral rates of pregnant and postpartum members through 12 months postpartum, and track inequities in screening and referral by interoperable REAL data. Analyze the information to identify disparities and develop processes to address those disparities.

☐ Ensure an adequate provider network, including behavioral health professionals with expertise in perinatal behavioral health. Analyze utilization numbers to periodically verify network adequacy.

☐ Make provider biographical data of providers easily accessible in provider directory to perinatal patients.

☐ Provide patient navigation services to support perinatal members finding perinatal and behavioral health care.

☐ Educate members on:
  - Signs and symptoms of behavioral health disorders including during the perinatal period.
  - All options to manage the perinatal episode including the postpartum period, including an obstetrician, a certified nurse midwife, nurse midwives, family medicine and doulas.

Appendix
Patient navigation services to support perinatal members finding perinatal and behavioral healthcare, and other perinatal support services that are covered and/or free and available to them during the perinatal period.

- Develop pathways to address or consider individual social needs, such as transportation to and from clinics, food insecurity and housing instability. Follow Foundation for Health Care Quality’s recommendations for developing and/or supporting resources for social needs.

**Purchasers**

- The Washington Health Care Authority (HCA) should work across systems, health professionals and agencies to increase access to perinatal integrated behavioral health, including facilitating care coordination between behavioral health providers, perinatal providers, and other members of the care team.

- Cover behavioral health consultation as part of perinatal health care and post-delivery in recognition of pregnancy being a significant life event.

- Cover diverse options for individuals to receive perinatal care so the member may choose care that best aligns with them and their desired birthing process, including individual providers (e.g., licensed midwives, certified nurse midwives, family practice, OB/Gyns, maternal fetal medicine specialists), care and delivery settings (hospital, freestanding birthing centers, home birth) and other
  - Educate members on the options available to them.
  - Expand coverage for community-based pregnancy and maternity care (e.g., midwives, home visits, group visits, community-based doulas)
Department of Health, Public Health Agencies and Urban Indian Health Organizations

- Increase education around perinatal behavioral health to reduce stigma and increase awareness of existing services.
  - Increase community education through partnerships with community organizations and public health agencies to reduce stigma and increase awareness.

- Increase access to community programs to support perinatal people with behavioral health conditions.

- Create education campaigns for the public on signs and symptoms of perinatal behavioral health concerns and where to go to receive care if a concern arises.
  - Collaborate across all public health care and social needs agencies (i.e. DSHS, DCYF, HCA, DOH, ESD, Commerce) in unified educational messaging

- Develop and support programs to address and consider individual social needs, such as transportation to and from clinics, food insecurity and housing instability. Follow Foundation for Health Care Quality’s recommendations for developing and/or supporting resources for social needs.
  - Support or partner with community-based organizations to provide these services.

- Educate doulas and other community birth workers on perinatal behavioral health signs, symptoms, and resources available to support them.

Washington State Legislature

- Fund the initial prenatal visit separately, including requiring behavioral health screening, social determinants of health (SDOH) screening and clinician face-to-face time in the initial obstetrical visit.

<td>Howard LM, Khalileh H. Perinatal mental health: a review of progress and challenges. World Psychiatry. 2020 Oct;19(3):313-327. doi: 10.1002/wps.20769. PMID: 32931106; PMCID: PMC7491613.</td>
<td>Perinatal mental health has become a significant focus of interest in recent years, with investment in new specialist mental health services in some high-income countries, and inpatient psychiatric mother and baby units in diverse settings. In this paper, we summarize and critically examine the epidemiology and impact of perinatal mental disorders, including emerging evidence of an increase of their prevalence in young pregnant women. We conclude with research and clinical implications, which, we argue, highlight the need for an extension of generic psychiatric services to include preconception care, and further investment into public health interventions, in addition to perinatal mental health services, potentially for women and men, to reduce maternal and child morbidity and mortality.</td>

| HealthAffairs October 2021 Issue on Perinatal Mental Health. [https://www.healthaffairs.org/maternal-health-and-perinatal-mental-health](https://www.healthaffairs.org/maternal-health-and-perinatal-mental-health) | The October 2021 issue of HealthAffairs offers several Perinatal Mental Health articles, including some focusing on policy and programs to expand access to care. |

| Reviewed multiple interventions for perinatal mood disorders. Counseling interventions associated with lower likelihood of onset of perinatal depression. Some other interventions, including health system interventions, showed some evidence of effectiveness but lacked robust evidence base. |

Bree Perinatal Behavioral Health Workgroup
Updated: November 13, 2023

This paper describes the creation of integrated behavioral health in a midwife practice in Arizona, with a special focus on the financial barriers that may hinder integrated models.

This article seeks to move the needle toward universal screening for PPD using validated tools in pediatric primary care settings for new caregivers by making the legal and ethical case for this course of action in a manner that is both compelling and accessible for clinicians. Toward this end, we summarize current literature as it applies to provider responsibilities, liabilities and perspectives; and caregiver autonomy, confidentiality, and privacy. We conclude that there is a strong ethical case for universal screening for PPD in pediatric primary care settings using validated tools when informed consent can be obtained and appropriate follow-up services are available and accessible.

Non-Latina Black women experienced higher rates of prenatal depressive symptoms and significantly lower use of postpartum counseling and medications. Those asked by a practitioner about their mental health status were almost six times more likely to report counseling.

Common facilitators included engaging multidisciplinary staff in program development and implementation, partnering with program champions, and incorporating screening into routine clinical practice. Referral to mental health treatment was the most significant barrier.

The most efficient strategy to identify patients at risk relies on focusing on clinically vulnerable subgroups: enquiries about depressive symptoms should be made at the usual screening visits. Attention should be paid to any sign of poor self-care, avoidance of eye contact, overactivity or underactivity, or abnormalities in the rate of speech.

Screening can be challenging for NICU providers due to constraints in time and resources. Screening protocols must include well-validated measures, trained staff to administer, and clear plans for addressing elevated risk. This highlights the need for the integration of mental health professionals into perinatal settings to help foster resilience in families during this vulnerable time.
Perinatal mental health refers to the mental health of individuals during pregnancy and the first year after giving birth. It is an essential aspect of maternal healthcare. Poor perinatal mental health can have serious consequences for both the mother and the child. Reports of the prevalence and incidence of these conditions vary; one study estimates that roughly 9% of pregnant individuals experience a perinatal mental health condition that can be lower than actual values given the challenges with access to data.2 These conditions include a wide range of mood and anxiety disorders, including depression, anxiety, bipolar disorder, postpartum depression, and postpartum psychosis. If not addressed, perinatal mood and anxiety disorders can lead to significant negative outcomes for both patients and their children.

Education and Communication

One in six women (17.3%) reported experiencing one or more types of mistreatment such as lack of autonomy; being worried about; being ignored, refused; or receiving no response to requests for help. Context of care (e.g., mode of delivery) was consistently higher even when examining interactions between race and other maternal characteristics.

Due to limited sample size, we did not see statistically significant associations between racial concordance and our variables of interest. However, the open-ended comments that we received reveal nuances and concerns in the maternal health field, including the value of support and guidance from other women who have been pregnant, and patients’ increasing comfort with self-advocacy with the provider over time.

The authors detail a case study of a universal PMAD screening program in rural Northern Arizona, using a nurse-led interdisciplinary program.

One in six women (17.3%) reported experiencing one or more types of mistreatment such as: lack of autonomy; being worried about; being ignored, refused; or receiving no response to requests for help. Context of care (e.g., mode of delivery) was consistently higher even when examining interactions between race and other maternal characteristics.

Due to limited sample size, we did not see statistically significant associations between racial concordance and our variables of interest. However, the open-ended comments that we received reveal nuances and concerns in the maternal health field, including the value of support and guidance from other women who have been pregnant, and patients’ increasing comfort with self-advocacy with the provider over time.

Over 40% of women reported communication problems in prenatal care, and 24% perceived discrimination during their hospitalization for birth. Having hypertension or diabetes was associated with higher levels of reluctance to ask questions and...

We found that beyond normative stress related to managing physical aspects of MHRP (medically high risk pregnancy), women reported added emotional stressors associated with navigating the fragmented health care environment. This study suggests that improved care coordination and systematic integration of psychosocial professionals within the perinatal interdisciplinary health care team are vital to reduce care-related stressors on this vulnerable patient group.

This article presents an overview of traumatic stress sequelae of childhood maltreatment and adversity, the impact of traumatic stress on childbearing, and technical assistance that is available from the National Center for Trauma-Informed Care (NCTIC) before articulating some steps to conceptualizing and implementing trauma-informed care into midwifery and other maternity care practices.

We propose practical communication, behavioral, and procedural considerations for integrating trauma-informed care principles into routine postpartum care, with attention to populations that have been marginalized. We see postpartum care as a critical component of holistic patient recovery and an opportunity to facilitate posttraumatic growth so that all families can thrive.

The focus of this bundle is perinatal mood and anxiety disorders. The bundle is modeled after other bundles released by the Council on Patient Safety in Women’s Health Care and provides broad direction for incorporaton perinatal mood and anxiety disorder screening, intervention, referral, and follow-up into maternity care practice across health care settings.

Women’s perceptions of better communication, collaboration, and empowerment from their midwives were associated with more frequent salutary health behavior practices in late pregnancy. Controlling for mid-pregnancy anxiety, lower anxiety in late pregnancy mediated associations of communication and collaboration with health behavior practices, indicating that these associations were attributable to reductions in anxiety from mid- to late pregnancy.

This report draws on literature reviews and interviews with maternal care stakeholders to explore how the pandemic is contributing to inequitable patient and provider experiences with maternal health care during the prenatal, delivery, and postpartum periods. We also explore the following promising strategies to consider.

**Behavioral Health**

The strongest risk factors for postpartum depressive symptoms were sick leave during pregnancy and a high number of visits to the antenatal care clinic. Complications during pregnancy, such as hyperemesis, premature contractions, and psychiatric disorder were more common in the postpartum subgroup of pregnant women.

The authors (Black midwives) respond to a recent article that surveyed black women about race and gender concordance. The authors offer a vision for race-concordant care that additionally encompasses cultural safety and care provided in a community-based setting.

**Integrated Behavioral Health**

This commentary highlights the experience of racism for Black women, and the vulnerability that occurs during pregnancy. The author concludes that training nurses and other health care providers about implicit bias is one step toward eradicating racism from maternity care.

This article detailed an anti-racism curriculum for current and future healthcare professionals. Although many participants were aware of anti-racism training, there was a lack of knowledge about structural context contributing to disparities. This training is especially important for health care professionals working with pregnant people.

This RCT examined home-visits from doulas and the impact on childbirth preparation class attendance, breastfeeding, and other infant safety measures. Maternal health outcomes were not measured. Conclusions for practices The doula-home-visiting intervention was associated with positive infant-care behaviors.

The evidence is very uncertain about the effect of home visits on maternal and neonatal mortality. Individualized care as part of a package of home visits probably improves depression scores at four months and increasing the frequency of home visits may improve exclusive breastfeeding rates and infant healthcare utilization. Maternal satisfaction may also be better with home visits compared to hospital check-ups. Overall, the certainty of evidence was found to be low and findings were not consistent among studies and comparisons.

**Focus groups that discuss the importance of doula-concordance. The authors offer a vision for culturally concordant care to improve outcomes for women, especially when the group care involves providers who are racially conscious.**

This qualitative study used focus groups of clients and staff of a group prenatal care. Participants consistently expressed the need for trust between doulas and clients. This study sought the opinions of Black peripartum women on group prenatal care. Participants consistently expressed the need for access to mental health care, and focused on mental health integration into group perinatal care. The evidence suggests that group prenatal care can address health disparities for Black women, especially when the group care involves providers who are racially conscious.

This Commentary offers reflections on the experiences of the authors during the research of the study. The authors discuss the importance of training nurses and other health care providers about implicit bias.

This study sought the opinions of Black peripartum women on group prenatal care. Participants consistently expressed the need for access to mental health care, and focused on mental health integration into group perinatal care. The evidence suggests that group prenatal care can address health disparities for Black women, especially when the group care involves providers who are racially conscious.

This qualitative study used focus groups of clients and staff of a culturally-specific perinatal care program. The main themes include: shared identities (between providers and clients/patients) facilitate trust and healing, racism impacts mental health, and advocacy is a vital service. The authors recommend culturally-specific approaches to perinatal care, and stronger mental health support.

**A qualitative study of women of color in San Francisco. Participants shared practical ways to improve care for women of color, focusing on person-centered care, relationship-building, and implicit bias training. The authors recommend that providers listen to and understand women of color during pregnancy.**

**This qualitative study focused on views of mothers and doulas about the impact of doulas on their experience.**

**The authors note that Black midwives have voiced concerns about racial concordance and the benefits of having Black health care providers during childbirth.**

**This commentary offers reflections on the experiences of the authors during the research of the study. The authors discuss the importance of training nurses and other health care providers about implicit bias.**

**This study sought the opinions of Black peripartum women on group prenatal care. This qualitative study focused on views of mothers and doulas about the impact of doulas on their experience. The authors note that Black midwives have voiced concerns about racial concordance and the benefits of having Black health care providers during childbirth.

Overall, psychosocial and psychological interventions significantly reduce the number of women who develop postpartum depression. Promising interventions include the provision of intensive, professionally-based postpartum home visits, telephone-based peer support, and interpersonal psychotherapy.

Implementation of a universal screening process for PMADs alongside the development of an IBH (integrated behavioral health) model in perinatal care has led to the creation of a program that is feasible and has the capacity to serve as a national model for improving perinatal mental health in vulnerable populations.

This article, from 2003, describes the need for integrated behavioral health in obstetrical care, especially as many patients treat OB care as their only primary care. The authors conclude that barriers to integrated care must be addressed.

This randomized control trial on group perinatal care found that babies from pregnant parents participating in group care were more likely to be appropriate for gestational age, although there were similar levels of depression and anxiety for pregnant parents.

This study on Medicaid patients in South Carolina examined the effect of group prenatal care on future well-child visits for pediatric care. The study found a modest increase in well-child visits for those in group prenatal care, although gaps in well-child visits persist regardless of prenatal care model.

This prospective cohort model examines the psychosocial outcomes of group prenatal care. The study determined that group prenatal care demonstrated an increase in prenatal planning-preparation coping strategies, but no significant greater positive outcomes in other measures. However, women who were at greater psychosocial risk benefited from group prenatal care, as they experienced a decrease in pregnancy-specific stress, higher mean maternal functioning scores postpartum, and a decrease in postpartum depressive symptom scores.

This mathematical cost-benefit modeling found that group prenatal care could be cost effective as long as an average of 10.652 pregnant parents are enrolled with enriched staff or 4.801 women are enrolled with a single staff member.

This systematic review identified 37 reports about group prenatal care to determine the outcomes for women enrolled in group prenatal care. Important findings include that preterm birth decreased among low-income and African American women, and attendance at prenatal visits was shown to increase among women in GPC. However, authors caution that there is not sufficient high-quality, well-controlled studies to draw conclusions.

A case study of implanting group prenatal care in Georgia’s Southwest Public Health district. They found positive outcomes for preterm birth and low-birth weight as well as increased breastfeeding. Additionally, the program was able to enroll mostly medically underserved women. No comments on behavioral health outcomes.

The authors searched the Cochrane Pregnancy and Childbirth Group’s Trials Register to determine all published and unpublished trials in which pregnant women were randomly assigned to midwife-led continuity models of care versus other models of care. The authors conclude that midwife-led continuity model of care leads to improved outcomes.

This study on Medicaid patients in South Carolina examined the effect of group prenatal care on future well-child visits for pediatric care. | Melville et al; Improving Care for Depression in Obstetrics and Gynecology: A Randomized Controlled Trial | Two-site randomized controlled trial included screen-positive women (Patient Health Questionnaire-9 of at least 10) who then met criteria for major depression, dysthymia or both (Mini-International Neuropsychiatric Interview). Women were randomized to 12 months of collaborative depression management or usual care; 6, 12 and 18-month outcomes were compared. The primary outcomes were change from baseline to 12-months on depression symptoms and functional status. Secondary outcomes included at least 50% decrease and remission in depressive symptoms, global improvement, treatment satisfaction, and quality of care. Results—Participants were on average 39 years old, 44% were non-white and 56% had posttraumatic stress disorder. Intervention (n=102) compared to usual care (n=103) patients had greater improvement in depressive symptoms at 12 months (P<.001) and 18 months (P=.004). The intervention group compared with usual care had improved functioning over 18 months (P<.05), were more likely to have an at least 50% decrease in depressive symptoms at 12 months (RR=1.74, 95% confidence interval [CI] 1.13–2.73), greater likelihood of at least 80% clinical mental health visits (6 month RR=2.70, 95% CI 1.73–4.20; 12 month RR=2.53, 95% CI 1.63–3.94), adequate dose of antidepressant (6-month RR=1.64, 95% CI 1.03–2.60; 12-month, RR=1.71, 95%CI 1.08 2.73), and greater satisfaction with care (6-month RR=1.70, 95% CI 1.19–2.44; 12-month RR=2.26, 95% CI 1.52–3.36). Conclusion—Collaborative depression care adapted to women’s health settings improved depressive and functional outcomes and quality of depression care. |
| Delivering perinatal depression care in a rural obstetric setting: a mixed methods study of feasibility, acceptability and effectiveness | Objectives: Universal screening for depression during pregnancy and postpartum is recommended, yet mental health treatment and follow-up rates among screen-positive women in rural settings are low. We studied the feasibility, acceptability and effectiveness of perinatal depression treatment integrated into a rural obstetric setting. Methods: We conducted an open treatment study of a screening and intervention program modified from the Depression Attention for Women Now (DAWN) Collaborative Care model in a rural obstetric clinic. Depression-screen positive pregnant and postpartum women received problem-solving therapy (PST) with or without antidepressants. A care coordinator coordinated communication between patient, obstetrician and psychiatric consultant. We measured change in the Patient Health Questionnaire 9 (PHQ-9) score. We used surveys and focus groups to measure patient and provider satisfaction and analyzed focus groups using qualitative analysis. Results: The intervention was well accepted by providers and patients, based on survey and focus group data. Feasibility was also evidenced by recruitment (87.1%) and retention (92.6%) rates and depression outcomes (64% with >50% improvement in PHQ-9) which were comparable to clinical trials in similar urban populations. Conclusions for practice: DAWN Collaborative Care modified for treatment of perinatal depression in a rural obstetric setting is feasible and acceptable. Behavioral health services integrated into rural obstetric settings could improve care for perinatal depression. |
| Grote N, Katon W, Russo J, Lohr M, Curran M, Galvin E, Carson K. Collaborative Care for Perinatal Depression in Socioeconomically disadvantaged women: a randomized trial. Depression and Anxiety, 2015. 32:821-834. DOI: 10.1002/da.22405 | Compared to public health maternity support services (MSS-Plus), the authors implemented “MOM-Care,” a culturally relevant, collaborative care intervention model. The model showed significant improvement in quality of care, depression severity, and remission rates, especially for socioeconomically disadvantaged women. |
| Miller ES, Jensen R, Hoffman MC, Osborne LM, McEvoy K, Grote N, Moses-Kolko EL. (2020) Implementation of perinatal collaborative care: a health services approach to perinatal depression care. Primary Health Care Research & Development 21(e30):1–9. doi: 10.1017/S1460323620000110 | Aim: Our objective was to integrate lessons learned from perinatal collaborative care programs across the United States, recognizing the diversity of practice settings and patient populations, to provide guidance on successful implementation. Background: Collaborative care is a health services delivery system that integrates behavioral health care into primary care. While efficacious, effectiveness requires rigorous attention to implementation to ensure adherence to the core evidence base. Methods: Implementation strategies are divided into three pragmatic stages: preparation, program launch, and program growth and sustainment; however, these steps are non-linear and dynamic. Findings: The discussion that follows is not meant to be prescriptive; rather, all implementation tasks should be thoughtfully tailored to the unique needs and setting of the obstetric community and patient population. In particular, we are aware that implementation on the level described here assumes commitment of both effort and money on the part of clinicians, administrators, and the health system, and that such financial resources are not always available. We conclude with synthesis of a survey of existing collaborative care programs to identify implementation practices of existing programs. |
| Increased Depression Screening and Treatment Recommendations After Implementation of a Perinatal Collaborative Care Program | Objective: The study evaluated whether implementation of perinatal collaborative care is associated with improvements in screening and treatment recommendations for perinatal depression by obstetric clinicians. Methods: This cohort study, conducted from January 2015 to January 2019, included all women who received prenatal care in five obstetric clinics and delivered at a single quaternary care hospital in Chicago. In January 2017, a perinatal collaborative care program (COMPASS) was implemented. Completion of depression screening and recommendations for treatment following a positive depression screen were compared before and after COMPASS implementation. Adjusted analyses included inverse probability weighting by using propensity scores to impose control over imbalance between exposure groups with respect to prespecified covariates. Results: A total of 7,028 women were included in these analyses: 3,227 (46%) before and 3,801 (54%) after COMPASS implementation. Women who received obstetric care after implementation were significantly more likely than those who received care before implementation to receive antenatal screening for depression (81% versus 33%; adjusted odds ratio [aOR]=8.5, 95% confidence interval [CI]57.6–9.5). After implementation, women with a positive antenatal screen for depression were more likely to receive a... |
Associations Between Implementation of the Collaborative Care Model and Disparities in Perinatal Depression Care

OBJECTIVE: To evaluate whether perinatal collaborative care model implementation was associated with a reduction in racial disparities in depression care.

METHODS: This retrospective cohort study included pregnant and postpartum people who self-identified as either Black or White, and received prenatal care at academic faculty offices affiliated with an urban quaternary medical center. Individuals were divided into two cohorts to reflect the epochs of implementation. The primary outcome was the frequency of depression screening. The secondary outcome was the frequency of provision of a treatment recommendation for those with a positive depression screen. Antenatal and postpartum care were analyzed separately. A propensity score was used in multivariable models to control for confounders chosen a priori across implementation epoch. Interaction terms were created between race and implementation epoch to identify whether effect modification was present. Subgroup analyses were performed for outcomes with significant race-by-epoch interaction terms.

RESULTS: Of the 4,710 individuals included in these analyses, 4,135 (87.8%) self-identified as White and 575 (12.2%) self-identified as Black. Before implementation, Black individuals were more likely to receive screening (adjusted odds ratio (aOR) 2.44) but less likely to have a treatment recommended when a positive screen was identified (aOR 0.05). In multivariable models, race-by-epoch interaction terms were significant for both antenatal screening (P = .001) and antenatal treatment recommendation (P = .045), demonstrating that implementation of the perinatal collaborative care model was associated with reductions in extant racial disparities. After implementation, there were no significant differences by race (referent = White) in screening for antenatal depression (aOR 1.22, 95% CI 0.89–1.68) or treatment recommendations for those who screened positive (aOR 0.64, 95% CI 0.27–1.53). Race-by-epoch interaction terms were not significant in multivariable models for either postpartum screening or treatment recommendation.

CONCLUSION: Implementation of the perinatal collaborative care model is associated with a mitigation of racial disparities in antenatal depression care and may be an equity-promoting intervention for maternal health.

A Systematic Review of Integrated Care Interventions Addressing Perinatal Depression Care in Ambulatory Obstetric Care Settings

This systematic review searched 4 databases (PubMed/MEDLINE, Scopus, CINAHL, and PsycINFO) and identified 21 articles eligible to evaluate the extent to which interventions that integrate depression care into outpatient obstetric practice are feasible, effective, acceptable, and sustainable. Despite limitations among the available studies including marked heterogeneity, there is evidence supporting feasibility, effectiveness, and acceptability. In general, this is an emerging field with promise that requires additional research. Critical to its real-world success will be consideration for practice workflow and logistics, and sustainability through novel reimbursement mechanisms.

Recent appreciation of the significance of nonfinancial barriers to prenatal care has resulted in recognition that even if all financial barriers were removed, there would still be access problems.

The pandemic has increased symptoms of perinatal depression and anxiety and impacted perceived access to care. Self-reported increases in depression and anxiety and changes to healthcare access varied by education, race/ethnicity, income, and positive screens. Understanding these differences is important to address perinatal mental health and provide equitable care.

This study aimed to understand the extent, range, and nature of mobile health (mHealth) tools for prevention, screening, and treatment of perinatal depression and anxiety in order to identify gaps and inform opportunities for future work. A total of 26 publications describing 22 unique studies were included (77% published after 2017). mHealth apps were slightly more common than testing-based interventions (12/22, 54%) vs 10/22, 45%). Most tools were for either depression (9/22, 41%); 1 tool was for anxiety only (1/22, 4%). Interventions starting in pregnancy and continuing into the postpartum period were rare (2/22, 9%). Tools were for prevention (10/22, 45%), screening (6/22, 27%), and treatment (6/22, 27%). Interventions delivered included psychoeducation (6/22, 73%), peer support (4/22, 18%), and psychological therapy (4/22, 18%). Cost was measured in 14% (3/22) studies.

Existing and emerging evidence indicates that perinatal depression is a key contributor to preventable morbidity and mortality during and after childbearing. Despite this, there are few effective options for prevention and treatment that are readily accessible for and appealing to pregnant people. In this article, we briefly summarize key systems barriers to delivering preventive care for perinatal depression in standard prenatal care clinics. We then describe Mindfulness-Based Cognitive Therapy for Perinatal Depression and outline our adaptation of this intervention, Center M. Finally, we identify next steps, challenges, and opportunities for this recent innovation.

Recent research suggests that identifying risk for perinatal depression including historical diagnoses of depression, anxiety, trauma, and comorbid substance use and intimate partner violence may move the field to focus on preventive care in peripartum populations. Emerging data shows stark health inequities in racial and ethnic minority populations historically marginalized by the healthcare system and in other vulnerable groups such as LGBTQ+ individuals and those with severe mental illness. Innovative models of care using systems-level approaches can provide opportunities for identification and risk analyses of vulnerable peripartum patients and facilitate access to therapeutic or preventive interventions. Utilizing intergenerational approaches and leveraging multidisciplinary teams that thoughtfully target high-risk women and other birthing individuals could promote significant changes to population-level care in maternal health.

Women are at high risk for and more vulnerable to perinatal mood and anxiety disorders (PMADs) during the coronavirus disease (COVID-19) pandemic. While access to specialized perinatal mental health services is limited, clinicians with whom women have ongoing relationships are in a unique position to counsel about prevention of PMADs. These clinicians include primary care, obstetric, and general mental health clinicians. By providing a woman with practical guidance and psychoeducation for perinatal planning (eg, about sleep, exercise, nutrition, and the importance of social supports), clinicians can mitigate a woman’s risk of PMADs. This practical guidance must be modified to fit the social context of the COVID-19 pandemic. This guidance can prevent or attenuate unnecessary suffering on the part of the mother and have a long-lasting impact on her child. This review provides a perinatal planning guide that outlines important topics to discuss and problem solve with women in the context of the COVID-19 pandemic.

This was a retrospective cohort study of women undergoing universal postpartum depression screening with deliveries from January 2017 to December 2019 who were compared with a historic cohort from the same population from June 2008 to March 2010. Utilization of mental health services following a positive postpartum depression screen was more doubled following the implementation of colocated services.historic cohort from the same population from June 2008 to March 2010

Women treated at the Perinatal mood disorder clinic (on-site) showed improved EPDS scores when receiving at least two separate care visits. Therefore, the clinic may be filling a gap in access to care for women with perinatal mood disorders.

This editorial presents: 1) a review of Perinatal Psychiatry Access Programs as an integrated care model with potential for promoting perinatal mental health equity; and 2) a summary of how the model has been and can be further adapted to help achieve perinatal mental health equity in geographically diverse settings.

This Editor’s Choice collection builds on the April 2019 perinatal psychiatry collection and highlights innovative service models across the care continuum, from screening to longitudinal treatment. The first set of articles details the large treatment gap for perinatal mental illness despite its association with pregnancy complications. The second set of articles discusses digital health tools (e.g., mobile apps and telepsychiatry) to support perinatal mental health screening and integrated care. The last group of
This is not a single article, but a full Edition of the journal Psychiatric Services, which includes several articles on perinatal mental health access and concerns. The articles discusses the benefits of perinatal collaborative care models in controlled trials and real-world settings in socioeconomically, racially, ethnically, and geographically diverse populations. It is incumbent upon mental health clinicians to build upon the innovations in this collection to expand access to perinatal mental health care with the goal of reversing the concerning rise in maternal morbidity and mortality.

Thirty-three interviews were conducted with 12 (36%) pregnant or postpartum women, 15 (45%) PCPs, and 6 (18%) mental health care providers. Barriers were categorized into three levels: individual, social, and society. Individual level barriers, including cost or lack of insurance and transportation, were consistent across groups, however, women identified barriers only at this level. Provider groups identified barriers at all levels, including lack of support, poor communication between providers, and Medicaid limitations.

The lifetime prevalence of major depressive disorder in women is approximately 20% within the U.S., with its onset occurring most among women of childbearing age (20-40 years). It is well established that a history of mental illness is a risk factor for mental health concerns during and after pregnancy (Beck, 2001; Bina & Harrington, 2017; Marcus, Flynn, Blow, & Barry, 2003; Robertson, Grace, Wallington, & Stewart, 2004). However, only a small number of women who meet criteria for major depressive disorder seek treatment with many women remaining undiagnosed and untreated (Ko, Farry, Dietz, & Robbins, 2012). Thus, there is a need to better understand whether history of depression prior to pregnancy is related to a variety of negative outcomes in the prenatal and postpartum periods such as increased psychiatric attention during the prenatal period.

Improving the value of maternity services will require public policies that measure and pay for quality rather than quantity of care. Equally important, clinicians will need to employ new strategies to deliver value, including considering prices, individualizing the use of new technologies, prioritizing team-based approaches to care, bridging pregnancy and contraception counseling, and engaging expecting families in new ways.

Developing relevant policies for perinatal mental health thus requires attending to the intersecting effects of racism, poverty, lack of child care, inadequate postpartum support, and other structural violence on health. To fully understand and address this issue, we use a human rights framework to articulate how and why policy makers must take progressive action toward this goal. This commentary, written by an interdisciplinary and intergenerational team, employs personal and professional expertise to disrupt underlying assumptions about psychosocial aspects of the perinatal experience and reimagines a new way forward to facilitate well-being in the perinatal period.

There is significant evidence that Perinatal Mental Health is a national public health issue seriously impacting the health and well-being of mothers, infants, fathers, partners, families and the broader community. Leading national organizations have issued guidance and statements on screening and follow-up care, national groups have convened in dialogue to discuss critical areas resulting in reports, and some key states have issued recommendations that are paving the way for change. However, still absent from these important efforts is a national framework and strategic action plan. In 2019, Postpartum Support International and The Reilly Group conducted an in-depth analysis of the available data and reports to begin the process of framing a collective response.

In the United States, mental health conditions are the most common complications of pregnancy and childbirth, and suicide and overdose combined are the leading cause of death for new mothers. Although awareness of and action on perinatal mental health is increasing, significant gaps remain. Screening and treatment are widely recommended but unevenly implemented, and policies and funding do not adequately support the mental health of childbearing people. As a result, treatable perinatal mental health conditions can have long-term, multigenerational negative consequences. This article provides an overview of the perinatal mental health landscape in the United States by identifying serious gaps in screening, education, and treatment; describing recent federal and state policy efforts; highlighting successful models of care; and offering recommendations for robust and integrated perinatal mental health care.

In this decision analytical model with a simulated cohort of 1000 pregnant individuals enrolled in Medicaid, sharing estimated savings offered more than double the financial incentives for clinicians to prevent postpartum depression than traditional VBP models, assuming continuous health insurance coverage (ie, no churn). This incentive decreased as rates of annual health insurance churn increased. These findings suggest that VBP models that share expected future savings may offer greater

Medicaid offered technical assistance to state agencies (Colorado, Maine, Mississippi, and Nevada) to implement value-based payments in maternal and infant health. This site provides more information about their resources and assistance.

IMI conducted a national review of practices and policies implemented to effectively leverage Medicaid to improve prenatal, perinatal, neonatal, and 12-month postpartum outcomes. The goal was to elevate examples of innovation, particularly partnerships between Medicaid health plans with community-based organizations (CBOs) to inform comprehensive and sustainable models and policies grounded in health equity. The prenatal-to-age-three framework provides the backdrop for the report, followed by a grounding in the policy landscape for perinatal and child health in Medicaid.

California: AB 3032/AB 2193

Washington: During Pregnancy, After Pregnancy

This (now slightly outdated) sheet contains information ONLY about states requiring perinatal depression screening in fee for service and whether or not those organizations require or recommend specific screening tools.

To address the maternal health crisis, state Medicaid programs must work with managed care plans to adopt a “continuum” approach to maternal health. Medicaid covered 42% of all US births in 2020 and must play a central role in any redesign of maternal health care delivery.

Congress should also require all states to provide continuous Medicaid coverage for 12 months postpartum (currently, states are only required to provide pregnancy-related Medicaid coverage for 60 days postpartum) and make significant investments in other efforts that reduce maternal morbidity and mortality, including the $470 million in the Fiscal Year (FY) 2023 President’s Budget.

This funding will expand maternal health initiatives in rural communities; implement implicit bias training for health care providers; create pregnancy medical demonstration projects; address the highest rates of perinatal health disparities, including by supporting the perinatal health workforce; strengthen data collection and evaluation; and address behavioral health disorders.

Integrating behavioral health into primary care is an important way to increase access to effective behavioral health treatment while maximizing the capacity of our very limited behavioral health workforce. There are many approaches to integration, but the Collaborative Care Model (CoCM) has the most robust evidence base, especially for anxiety and depression.1 Compared to the usual primary care approach to managing behavioral health needs, in which a provider either refers the patient to a specialist or manages needs on their own, CoCM offers supports for the providers and delivers superior clinical outcomes for common, less complex behavioral health conditions.

Perigee Fund partners with organizations whose initiatives support the infant-caregiver relationship and increase the capacity for all families to experience healthy, joyful connections. We focus our funding and resources on two key areas – Mental Health and Family Supports for Well-Being – particularly initiatives that center communities of color.

Maternal mental health disorders are a major public health problem, affecting thousands of women, children, and families. Communities all around the country are mobilizing to identify and address perinatal depression and anxiety, and to support pregnant and parenting families.

Use this page to learn more about how to engage partners, raise awareness, and develop networks in your community.

Washington Maternal Mental Health Access (MaMHA) in the Department of Psychiatry and Behavioral Sciences, University of Washington (UW), is a funded program through the Perinatal Unit of the Office of Family and Community Health Improvement, Washington State Department of Health (DOH), to train and support members of WA primary care clinics to decrease perinatal suicide risk and accidental opioid overdose.

The guidance is organized into four core roles that healthcare provider institutions play, as:

- Providers: Provide whole-person care to achieve maternal health equity
- Employers: Employ and support a diverse maternal health workforce
- Community Partners: Engage with individuals and organizations in the community to achieve maternal health equity
- Advocates: Advocate for and invest in maternal health equity

Appendix A Culturally Humble Care

Culturally humble care is an essential component of providing effective, patient-centered perinatal care. Cultural humility in healthcare emphasizes the importance of acknowledging power imbalances, practicing self-reflection and developing partnerships in healthcare delivery, as opposed to cultural competence which emphasizes the acquisition of knowledge and skills related to different cultures. It, “incorporates elements of self-questioning, immersion into an individual patient’s point of view, active listening and flexibility, which all serve to confront and address personal and cultural biases or assumptions.” When healthcare providers approach patient care in this way, the professional nurtures communication between them and their patients, allowing for the development of shared goals and patient-centeredness in all interactions and activities. Cultural humility relies on a life-long learning process in which a provider is “flexible and humble enough to assess anew the cultural dimensions of the experiences of each [person].” Rather than having a static endpoint, self-questioning and self-critique, and active listening become part of the process.

Person-centered care starts with the use of non-stigmatizing language in written materials and in personal encounters. The University of California San Francisco offers the resource for HIV #LanguageMatters: Addressing Stigma by Using Preferred Language available here. Example: Person living with HIV rather than HIV infected person.

Abuse, violence, and other forms of trauma are widespread. The landmark 1998 study on adverse childhood experiences (ACEs) shows the high prevalence of ACEs across populations and links these experiences to a lifetime risk of poor health outcomes such as alcoholism, depression, heart disease, cancer, and obesity. While children are highly sensitive to trauma, as seen through these later health impacts, trauma is also impactful for adults. Trauma-informed care is built on understanding a person’s individual life experiences (e.g., asking what has happened to you) and the need for clinical encounters to empower rather than re-traumatize a person. The term was developed to integrate an understanding and strategies to mitigate trauma into delivery of behavioral health care and has since been adapted to physical health services and to delivery of integrated physical and behavioral health services. Many of the individual elements have been regularly used in the delivery of care for decades including addressing a person’s distress, providing emotional support, encourages positive coping, but practice is ahead of literature and no best-practice guideline or widely used metric to track practitioner adherence to trauma-informed care exists.

Integrating trauma-related issues into counseling has had positive effects for survivors of physical and sexual abuse and shown reductions in mental health symptoms. In many cases, providers operate under the assumption that someone has experienced trauma without directly asking whether this is so, a universal precautions approach. Key aspects include fostering a person’s feeling of safety in the clinical encounter and developing a positive, trusting person-provider relationship. Trust is based in one party being vulnerable, such as through having an illness or a lower level of knowledge and believing the other party will care for their interests. Fidelity, competency, honesty, and confidentiality are also dimensions of trust.

This workgroup does not endorse a single guideline for trauma-informed care as this care philosophy cannot be operationalized through a checklist, although checklists can serve as a starting point.
Many organizations have developed toolkits to support trauma-informed care. The Centers for Disease Control and Prevention lists six principles to a trauma-informed approach: 34

- **Safety**: Staff and people receiving care feel physically and psychologically safe
- **Trustworthiness and transparency**
- **Peer support**: Those with lived experience of trauma as allies in recovery or using stories
- **Collaboration and mutuality**: Decision making is shared, power differentials among staff or between providers and people receiving care are reduced
- **Choice**: Empowerment and self-advocacy
- **Cultural, historical and gender issues**: Recognizing and addressing historical trauma, removing provider bias, care that is responsive to cultural background

Moving to a trauma-informed approach in a clinical setting starts with being trauma-aware, as the Substance Abuse and Mental Health Services Association (SAMHSA) does through their four Rs: 35

- **Realization** that anyone may have experienced trauma and behavior can be understood as a coping strategy to address past trauma
- **Recognize** the signs of trauma
- **Respond** to the above through using a universal precautions approach (e.g., all people are approached as though they have experienced trauma)
- **Resist Re-traumatization** by seeking to not create toxic or stressful environments

While a universal trauma precautions approach negates the need for explicit trauma screening, some practices, such as pediatric practices, have found screening to be helpful. The American Academy of Pediatrics offers clinical assessment tools for people who have been exposed to violence here, including adverse childhood experiences. The signs of trauma are diverse, varying from person to person, include emotional, physical, cognitive, and behavioral signs, and may change over time. 36 A non-exhaustive list includes:

- **Emotional**: Emotional dysregulation anger, anxiety, sadness, and shame, numbing or detachment
- **Physical**: sleep disturbances; gastrointestinal, cardiovascular, neurological, musculoskeletal, respiratory, and dermatological disorders; urological problems; and substance use disorders
- **Cognitive**: Cognitive errors, misinterpreting situations as dangerous, excessive or inappropriate guilt, idealization, rationalization, delusions, intrusive thoughts or memories
- **Behavioral**: reenactments, self-harm or self-destructive behaviors

For individuals that use substances, harm reduction approaches are critical and evidence-based to improve outcomes and save lives. 37 Harm reduction is, “a practical and transformative approach that incorporates community-driven public health strategies — including prevention, risk reduction, and health promotion — to empower people who use drugs (and their families) with the choice to live healthy, self-directed, and purpose-filled lives.” Harm reduction focuses on comprehensive prevention and continuity of care, emphasizing overdose education, and distribution of reversal medications.

The Academy of Perinatal Harm Reduction published a patient-facing toolkit on Pregnancy and Substance Use, updated in 2022, that provides education to parents on harm reduction while using
various substances, input on navigating the healthcare and legal systems, and considerations from prenatal through postpartum care periods.

Appendix B Behavioral Health Support Services

Pregnant people, their children and families may require supportive services to align person-centered pregnant person-dyad care with their social and physical needs, goals, values, capacities, and preferences. This section focuses primarily on support services related to behavioral health for pregnant and postpartum patients. These support services should be integrated into the birth plan and perinatal clinical care plan.

**Partnership Access Line (PAL) for Moms**: University of Washington (UW) Partnership Access Line for Moms (PAL for Moms) is a free telephone consultation service for health care providers caring for patients with mental health problems who are pregnant, postpartum, or planning pregnancy. Any health care provider in Washington State can receive consultation, recommendations, and referrals to community resources from a UW psychiatrist with expertise in perinatal mental health.

Psychiatrists provide consultation on any mental health-related question for patients who are pregnant, in the first year postpartum, who are planning pregnancy, or who have pregnancy-related complications (e.g. pregnancy loss, infertility). Topics may include depression, anxiety, or other psychiatric disorders; adjustment to pregnancy loss, complications, or difficult life events; risks of psychiatric medications; non-medication treatments; and consulting about women on psychotropic medications who are wanting to or thinking about getting pregnant.

Perinatal psychiatrists are also available to help any practice thinking about instituting routine screening for depression. They can come to a clinic and provide a broad overview of best practices for depression screening and follow-up in the perinatal period.

The phone line **877-725-4666 (PAL4MOM)**, is staffed weekdays from **9 AM to 5 PM**. Providers can call at any time and receive a call back within one working day. Providers can also e-mail with any questions or to set up a consultation at ppcl@uw.edu.

View their [Perinatal Mental Health Care Guide 2023](#) which provides general guidance and workflows for behavioral health and other concerns in the pregnant and postpartum period.

**Perinatal Support Washington Warm Line**: Perinatal Support Washington is a state-wide non-profit that aims to support efforts to address perinatal mental health. Their **warm line** is a toll-free telephone peer support line for parents in need.

Parents can call or text **1-888-404-7763** to speak to a parent who has experience with perinatal mood and/or anxiety disorders and can connect them with licensed therapists trained in perinatal mental health. Patient-facing flyers can be found [here](#).

They maintain a directory with various kinds of support for all over the state that helps parents find the kinds of support they need, including doulas, lactation consultants, midwifery, primary care, and support groups. Learn more [here](#).
Parent-Child Assistance Program (PCAP): PCAP is an evidence-based home visitation case-management model for birthing parents on Apple Health who abuse alcohol or drugs during pregnancy. Its goals are to help mothers build healthy families and prevent future births of children exposed prenatally to alcohol and drugs. A client who is pregnant or postpartum, self-reports heavy substance use during the current or recent pregnancy and has not successfully accessed community resources for substance use treatment and long-term recovery is eligible for PCAP.

More information about the PCAP program can be found here.

988: (call, text or chat 988) 9-8-8 is a suicide & crisis lifeline that is confidential, free and available 24/7 all year. Anyone can contact to get support for thoughts of suicide, mental health crises, substance use concerns or any kind of emotional distress. Partners or loved ones can also call about someone they are concerned about. Services are available in Spanish and over 240 languages and dialects through interpretation.

For more information, click here.

If you use American Sign Language, you can get crisis support in ASL by visiting 988lifeline.org, selecting the “For Deaf & Hard of Hearing” link and selecting “ASL Now” on the next page.

Native and Strong Lifeline: Native and Strong is a crisis line specifically for native and/or indigenous peoples in Washington state. Anyone can call it by dialing 988 and selecting option 4. Callers will be connected to Native counselors who can support Native people experiencing a mental health crisis, thinking about suicide or seeking emotional support. You can also call if you are concerned about a loved one. Conversations are kept confidential, and counselors consider culture and tradition as they connect with people in crisis.

Visit their website here, or call 866-491-1683.

211: 2-1-1 is an easy-to-remember phone number for people to call for health and human service information and referrals and other assistance to meet their needs. Pregnant and postpartum patients can call 2-1-1 (or 1-877-211-9274) to get connected with mental health providers within their area.

Click here for more information.

Maternal Mental Health Hotline: The Maternal Mental Health Hotline is a national 24/7 free confidential support line for individuals before, during or after pregnancy. They offer phone or text access, real-time support, information and referrals to resources, providers and support groups in the area. They also offer counselors who speak English and Spanish, and have interpreter services for over 60 languages.

Call or text 1-833-TLC-MAMA (1-833-852-6262). TTY users can use a preferred relay service or dial 711 and then 1-833-852-6262. To see more information, click here.

Crisis Line: Patients thinking of suicide or are in crisis can call 1-866-427-4747.
Appendix C Additional Support Services

While this report focuses on perinatal behavioral health, holistic person-centered care cannot separate behavioral from medical wellness. Many support services across the state provide both behavioral health support and other forms of support needed to have a healthy pregnancy and postpartum period. Therefore, providers should consider all resources available to support the parent-child dyad through the perinatal period. The following section focuses primarily on support services for Apple Health moms and babies. To support the birthing parent’s choices and goals, support services should be integrated into the birth plan and clinical care plan.

Commercial health plans may provide support services using maternity case management, lactation consulting, breastfeeding support, or other services during the maternity and newborn episode. Gestational parents may also self-pay for support services, such as doulas, that follow their birth plan and pregnancy and delivery goals. Clinicians and their teams can learn more about support services for birthing parents and babies with commercial health plan coverage by contacting the birthing parent’s health plan.

Apple Health Member Support Services

First Steps Maternity Support Services (MSS): Any pregnant or up to 60 days postpartum Medicaid Enrollees are eligible for MSS. MSS is an optional, enhanced service which is reimbursed fee for service. The services provided may take place in an office setting, the client’s home or an alternate location. The purpose of MSS is to improve and promote healthy birth outcomes using an interdisciplinary team consisting of a registered nurse, behavioral health specialist, and registered dietitian. Some MSS providers also have community health workers as part of the team. MSS helps clients access prenatal care as early as possible and obtain health care for eligible infants. MSS covered services consist of screening for risk factors, interventions for identified risk factors, brief counseling, education related to pregnancy and infant health, basic health messages, breastfeeding support, referrals to community resources, case management, and care coordination.

For more information and to find an MSS provider in your area, check the MSS Provider Directory, click here or call the Help Me Grow Washington Hotline at 1-800-322-2588.

First Steps Childbirth Education (CBE): Any pregnant client covered by Washington Medicaid is eligible for at least six hours of education provided by a Health Care Authority-approved CBE educator who accepts Apple Health. Education must include topics related to pregnancy, labor and birth, and newborn care.

For more information and to find a HCA-approved CBE educators, click here or call the Help Me Grow Washington Hotline at 1-800-322-2588.

Doula: The goal of doula services is to reduce disparities in birth outcomes among racial, ethnic, and geographic populations; improve birth outcomes by reducing preterm birth, low birth rate, cesarean sections; shorten labor time; reduce the need for pain medications; reduce consequences associated with morbidities such as severe lacerations and hemorrhage; and improve rates of breastfeeding and length of time babies are breastfed. Legislation requires the Health Care Authority to implement doula services through the First Steps Maternity Support Services (MSS) program. HCA is collaborating with
partner agencies, doula advocates, and MSS providers to determine cost savings and how best to implement. HCA is also working with the Centers for Medicare and Medicaid Services (CMS) to add doulas as an allowable provider in the Medicaid State Plan to reimburse for services.

Please sign up for [HCA’s doula listserv](#) to stay informed as HCA works to implement doula services.

**Women, Infants and Children (WIC) Nutrition Program**: WIC is a federal assistance program benefitting pregnant individuals, new and breastfeeding birth parents and children under 5 years of age by supplementing their diet with healthy foods, promoting and supporting breastfeeding and other healthy habits, and referring families to healthcare. Participating in WIC does not affect immigration status.

For more information on finding WIC services in your area, Call the Help Me Grow WA Hotline **1-800-322-2588** or Text "WIC" to **96859**. Healthcare providers, click [here](#) to learn more.

**Additional Support Services**

**Home Visiting for Families (DCYF)**: This program provides voluntary services in the home to expecting parents and families with infants and young children. Visits focus on linking families to health care and other community resources, promoting strong parent-child attachment, and coaching parents on learning activities to help their child’s development. Visits also include regular screenings to help parents identify possible health and developmental issues.

Find a local home visiting program by calling the Help Me Grow Washington Hotline at **1-800-322-2588**.

**Nurse-Family Partnership (NFP)**: NFP is a unique community health home visiting program that pairs nurse home visits with specialized training with parents to provide education, support and confidence in their ability to succeed. Extensive research has shown improvement in childhood outcomes like a reduction in behavioral health and intellectual problems at age 6, reduction in likelihood of experiencing child abuse and neglect, and reduction in ER visits for accidents and poisonings. They have locations across Washington State and serve thousands of families every year.

For more information and to find an NFP program in Washington, click [here](#).

**WithinReach**: A not-for-profit organization that provides multiple ways for people to access support in person, over the phone and online to find resources in their community. WithinReach is a leader and coalition builder for programs such as Basic Food education, Medicaid outreach and immunization action in Washington State. WithinReach’s [ParentHelp123](#) website assists pregnant patients and families in finding resources like food banks, play and learn groups, free or low-cost health clinics by entering their zip code.

Patients can also call WithinReach’s Help Me Grow Hotline at **1-800-322-2588** to apply for Medicaid online or be referred to other resources.

**Native Resource Hub by Volunteers of America Tribal Services**: The Native Resource Hub is a resource specifically for individuals who identify as Native American and/or Alaska Native. The hub supports native resources like follow up on calls to the Native and Strong Lifeline, care coordination, contact for
tribal DCRs, and provide light case management. The hub was developed in partnership with the Tribal Centric Behavioral Health Advisory Board, the American Indian Health Commission, The WA State Health Care Authority and the Washington Department of Health.

Learn more [here](#) or call 1-866-491-1683 to get connected.

**211:** 211 is a confidential, free community service hotline that connects individuals to local services including utility assistance, food, housing, healthcare, childcare, afterschool programs, crisis intervention and more. Individuals can call from anywhere in Washington state and reach a referral specialist to assist in assessing needs and finding services that address them. Referrals can be initiated via phone, email or text, TTY for people with deafness or hard of hearing and interpreters are available for over 140 languages.

Call **2-1-1** for assistance, or click [here](#) to learn more.

### Appendix D Provider and Allied Professionals Trainings

To provide equitable and effective care to pregnant and postpartum individuals experiencing behavioral health concerns or conditions, providers and allied professionals need training to that provides information on evidence-based/evidence-informed approaches to treatment and support. This section focuses on training opportunities for providers, other members of the care team and allied birthing professionals.

**Perinatal Support Washington:** Perinatal Support Washington offers provider trainings and events focused on perinatal mental health. Trainings focus on best practices in prevention, identification and treatment of PMADs, Birth trauma for therapists and allied birth professionals and special topics in perinatal mental health. Trainings often provide CEUs/CMEs for licensed providers. They locate trainings in different areas of the state and offer customized training for staff.

Learn more about and see upcoming trainings [here](#)

Contact Perinatal Support WA about custom trainings [here](#)

**Mom’s Access Project (MAP) ECHO:** MAP ECHO is a 10-session CME accredited program for providers that care for perinatal patients in Washington can participate in to improve provider capacity to care for perinatal behavioral health. Perinatal psychiatrists, obstetrician-gynecologists, maternal fetal medicine experts, ARNPs, therapists and social workers from the University of Washington School of Medicine facilitate the conference series, and providers from across the state are welcome to register.

For more information, please click [here](#).

**Marce Society of North America:** The International Marce Society for Perinatal Mental Health is an international organization focused on the prevention and treatment of mental illness in childbearing. They aim to promote the spread of research into all aspects of mental health for birthing parents, their infants, and partners around the time of childbirth. Past virtual workshops have included prescription considerations for depression during pregnancy, and the prevention of perinatal depression.

To find out for about MONA and their resources, click [here](#).
Appendix E Patient Educational Resources

**Lactation Guidance for Healthcare Professionals:** The Department of Health generated guidance on lactation and substance use in June 2023. This resource outlines concerns and guidance related to lactation and parental substance use, detailing specific safety concerns, adverse effects, considerations, and monitoring suggestions for specific substances such as opioids, benzodiazepines, stimulants, alcohol, cannabis, and tobacco/nicotine. They also offer screening tools for use during lactation support.

Link [here](#).

**Perinatal Support Washington:** Perinatal Support Washington has resource guides and toolkits for parents, including resources in multiple languages and resources specific to families of color. Providers and health delivery systems can order warm line educational flyers on the website.

Link here for [resources](#) for parents and children.

Appendix I  The Bree Collaborative: Perinatal Behavioral Health Charter and Roster

Problem Statement
Perinatal depression is one of the most common pregnancy complications, affecting one in seven women, and may contribute to adverse neonatal, infant, and child outcomes. Both the US Preventative Services Task Force and the American College of Obstetrics and Gynecology recommend screening for depression and anxiety during pregnancy and the post-partum period, as well as initiating treatment or referring to mental health care providers for maximum benefit. Despite these recommendations, stigma around mental illness, lack of insurance coverage for behavioral health, and structural barriers all prevent access to quality mental health care.

Aim
To improve the mental health care continuum in Washington State along the reproductive or family building journey including the perinatal and postpartum period.

Purpose
To propose practical and evidence-informed recommendations to the full Bree Collaborative on reducing the burden of perinatal/maternal mental health including:

- Defining topic area and scope.
- Expand inclusive definitions and services.
- Advancing equity and addressing inequities in perinatal/maternal mental health prevention, treatment, resources, and supports.
- Uplift culturally, relevant, and linguistically appropriate care.
- Acknowledge the impact of interpersonal and structural racism on people’s perinatal mental health and overall health.
- Identifying at-risk populations and increasing screening activities.
- Identifying mechanisms for following-up with brief interventions, treatment, or referrals to mental health services.
- Improving access to quality mental health services.
- Addressing structural determinants and other barriers to perinatal/maternal mental health.

Duties & Functions
The workgroup will:

- Research evidence-informed and expert-opinion informed guidelines and best practices (emerging and established).
- Make recommendations for inclusive care and language.
- Acknowledge how current structures contribute to inequality.
- Identify current barriers and future opportunities for implementing interventions.
- Consult relevant professional associations and other stakeholder organizations and subject matter experts for feedback, as appropriate.

---

Bree Perinatal Behavioral Health Workgroup
Updated: November 13, 2023

- Meet for approximately nine months, as needed.
- Provide updates at Bree Collaborative meetings.
- Post draft report(s) on the Bree Collaborative website for public comment prior to sending report to the Bree Collaborative for approval and adoption.
- Present findings and recommendations in a report.
- Recommend data-driven and practical implementation strategies including metrics or a process for measurement.
- Create and oversee subsequent subgroups to help carry out the work, as needed.
- Revise this charter as necessary based on scope of work.

Structure
The workgroup will consist of individuals confirmed by Bree Collaborative members or appointed by the chair of the Bree Collaborative. The Bree Collaborative director and program coordinator will staff and provide management and support services for the workgroup.

Less than the full workgroup may convene to: gather and discuss information; conduct research; analyze relevant issues and facts; or draft recommendations for the deliberation of the full workgroup. A quorum shall be a simple majority and shall be required to accept and approve recommendations to send to the Bree Collaborative.

Meetings
The workgroup will hold meetings as necessary. Bree Collaborative staff will conduct meetings, arrange for the recording of each meeting, and distribute meeting agendas and other materials prior to each meeting. Additional workgroup members may be added at the discretion of the Bree Collaborative director.
