

# Hepatitis C Virus Guideline Checklist

## Delivery Sites & Health Systems-Level 1

## The current state of the issue

The number of acute HCV cases has been steadily increasing in the United States between 2012-2019, with an estimated 133% increase in acute cases reported in 2019 compared to 2012. While the cure cascade for HCV is well-defined, disparities in testing and treatment prevent many patients from accessing treatment. The greatest gap occurs between diagnosis and treatment. In Washington, only an estimated 12% of patients with diagnosed HCV infections start direct-acting antiviral treatment. Together, we can support the screening and treatment of individuals with HCV to reach our goal of eliminating Hepatitis C in Washington State by 2030.

### Increase screening opportunities

- ☐ Ensure screening is offered to all patients aged 18 to 79 and pregnant people during each pregnancy.
- ☐ Confirm that if an HCV antibody screening test is reactive in a laboratory, the lab automatically reflexes to a PCR test to confirm the diagnosis.
- ☐ Report HCV+ tests to the local public health jurisdiction within two business days.

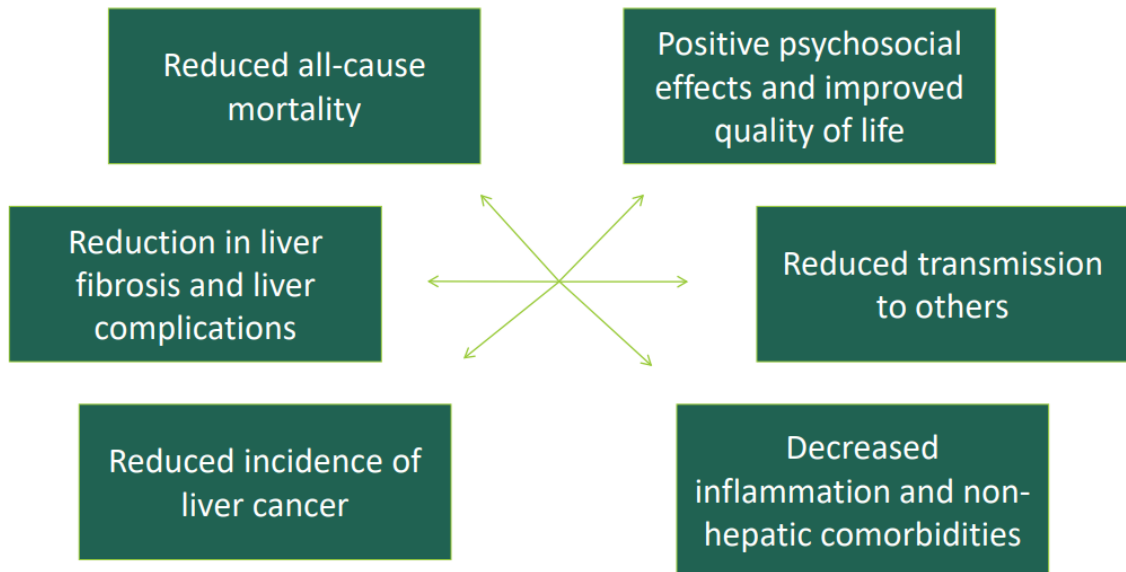

### Strengthen the capacity to treat and cure individuals

- ☐ Understand the background and urgency of the public health threat of HCV and efforts to eliminate this threat in WA state.
- ☐ Ensure adequate training and support for all providers with prescribing authority to treat hepatitis C, including primary care providers.
- ☐ Offer and encourage vaccination for Hep A and Hep B.

### Support the coordination of care

- ☐ Review current resources on HCV case management and care coordination.

## Benefits of Eliminating HCV

## Resources

- The Bree Report on HCV is meant to supplement these resources.
