

Hepatitis C Virus Guideline Checklist

Health Plan-Level 3

The current state of the issue

The number of acute HCV cases has been steadily increasing in the United States between 2012-2019, with an estimated 133% increase in acute cases reported in 2019 compared to 2012. While the cure cascade for HCV is well-defined, disparities in testing and treatment prevent many patients from accessing treatment. The greatest gap occurs between diagnosis and treatment. In Washington, only an estimated 12% of patients with diagnosed HCV infections start direct-acting antiviral treatment. Together, we can support the screening and treatment of individuals with HCV to reach our goal of eliminating Hepatitis C in Washington State by 2030.

Strengthen the capacity to treat and cure individuals

- ☐ Incentivize HCV treatment through novel reimbursement pathways.

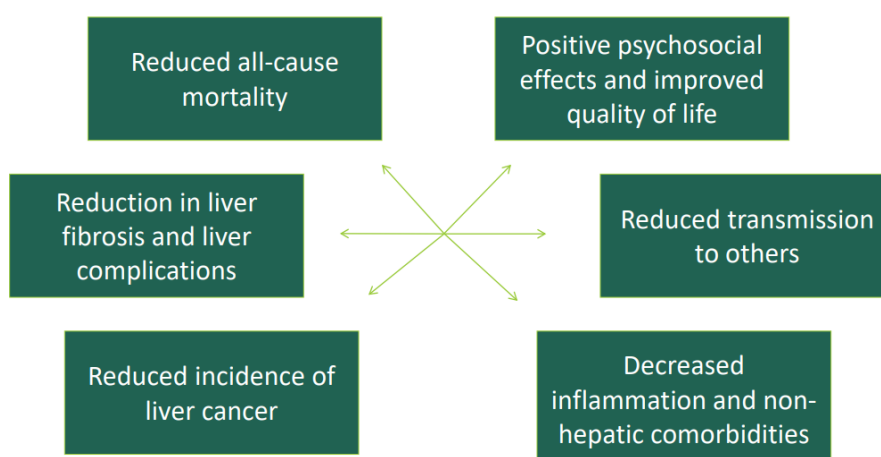

Use an interdisciplinary team

- ☐ Develop reimbursement models for pharmacists to treat HCV, like Medication Therapy Management (MTM) reimbursements.
- ☐ Reimburse retail pharmacies for HCV screening and testing services.

Support the coordination of care

- ☐ Offer risk-adjusted pool payments or consider bundled payments to help support care coordination services for providing services for patients with HCV, in addition to reimbursements for medications and office visits.
- ☐ Provide equitable and accessible care coordination services for plan enrollees that help connect enrollees to HCV services and address potential social need.
- ☐ Ensure that in-person, local care coordination services are available or reimbursed as needed.
- ☐ Consider partnerships with community-based care coordination programs to provide these on-the-ground, field-based services.

Benefits of Eliminating HCV
