# **Hepatitis C Virus** Recommendation Checklist Health Plan-Level 3

## The current state of the issue

The number of acute HCV cases has been steadily increasing in the United States between 2012-2019, with an estimated 133% increase in acute cases reported in 2019 compared to 2012. While the cure cascade for HCV is well-defined, disparities in testing and treatment prevent many patients from accessing treatment. The greatest gap occurs between diagnosis and treatment. In Washington, only an estimated 12% of patients with diagnosed HCV infections start direct-acting antiviral treatment. Together, we can support the screening and treatment of individuals with HCV to reach our goal of eliminating Hepatitis C in Washington State by 2030.

Strengthen the capacity to treat and cure individuals
Incentivize HCV treatment through novel reimbursement pathways.
Use an interdisciplinary team
Develop reimbursement models for pharmacists to treat HCV, like Medication Therapy Management (MTM) reimbursements.  Reimburse retail pharmacies for HCV screening and testing services.
Support the coordination of care
Offer risk-adjusted pool payments or consider bundled payments to help support care coordination services for providing services for patients with HCV, in addition to reimbursements for medications and office visits.  Provide equitable and accessible care coordination services for plan enrollees that

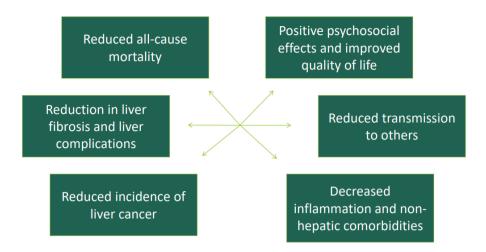

☐ Consider partnerships with community-based care coordination programs to provide these on-the-ground, field-based services.

Ensure that in-person, local care coordination services are available or reimbursed as

help connect enrollees to HCV services and address potential social need.

needed.

### **Benefits of Eliminating HCV**
